Working with substrate information in opm

Lea A.I. Vaas Leibniz Institute DSMZ Johannes Sikorski Leibniz Institute DSMZ Markus Göker Leibniz Institute DSMZ

Abstract

This is the substrate-information tutorial of **opm** in the version of September 30, 2013.

Keywords: Cell Lines, Metadata, Microbiology, Respiration Kinetics, Pathway, KEGG, pathview.

1. Introduction

A detailed description of the OmniLog® Phenotype MicroArray (PM) system, its measuring procedure and data characteristics are found in the vignette "opm: An R Package for Analysing OmniLog® Phenotype MicroArray Data" (called "main tutorial" in the following). The description of the methods below presupposes that the user is familiar with the usage of opm and has studied the main tutorial as well as the entries of the opm manual relevant to her or his research.

In addition to visual inspection or statistical comparative analyses of Phenotype Microarray data as described in the main manual, users might be interested in specific information on the substrates used in PM assays. The **opm** package offers a variety of additional data on PM substrates. In conjunction with other packages, it is possible to visualize PM results directly in pathway maps as delivered by the KEGG database. This can be done directly for the estimated curve parameters from one to several plates. But visualization of the results of an **opm_mcp** analysis is also possible, which offers more (statistically interesting) opportunities for making sense of the PM data in the context of pathways. The **annotated** methods described in detail below also generates datasets that can be used for analyses of interdependencies of substrate features and PM results. This can be used to determine which pathways are actually of interest before proceeding with the visualization of the PM results within these pathways.

2. Preparation

Before starting, both the **opm** package and **opmdata**, containing example data introduced and explained in detail in the main tutorial, should be loaded into an R session as follows:

```
R> library("opm")
R> data(vaas_et_al, package = "opmdata")
```

3. Available plate information

Currently substrate layouts of various plates are available within **opm**. An overview about the plate types available in the respective version of **opm** is obtained by entering

```
R> plate_type(full = TRUE)
```

These not only include OmniLog® plates; see the manual and the main tutorial for further details. Using other values for full, or additional arguments, distinct spelling variants can be obtained.

4. Accessing substrate information

The **opm** package contains a number of functions suitable for accessing precomputed information on the substrates within certain wells and entire plates. In the manual and help pages these functions are contained in the family "naming-functions" with according cross-references. One usually would start a search by determining the exact spelling of an internally used name with find_substrate():

```
R> substrates <- find_substrate(c("Glutamine", "Glutamic acid"))
R> substrates
```

The results is a list (of the \$3 class "substrate_match") containing character vectors with the results for each query name as values. Surprisingly, nothing was found for "Glutamic acid" but several values for "Glutamine". The default search argument is "exact", which is exact (case-sensitive) matching of substrings of the names. One might want to use "glob" searching mode:

```
R> substrates <- find_substrate(c("L-Glutamine", "L-Glutamic acid"), "glob") R> substrates
```

But with so-called wildcards, i.e. "*" for zero to many and "?" for a single arbitrary character the search is more flexible:

```
R> substrates <- find_substrate(c("*L-Glutamine", "*L-Glutamic acid"), "glob") R> substrates
```

This fetches all terms that end in either query character string, and does so case-insensitively. Advanced users can apply the much more powerful "regex" and "approx" search modes; see the manual for details, entry ?find_substrate.

Note that **opm** appends a concentration (or just repetition) indicator as a number after a hash sign ("#") to the substrate names wherever necessary. Thus a wildcard at the end of a name might often by the most useful search pattern.

Once the internally used names (which are not guaranteed to be stable between distinct **opm** releases) have been found, information on the substrates can be queried such as their occurrences and positions on plates:

```
R> positions <- find_positions(substrates)
R> positions
```

This yields a nested list containing two-column matrices with plate names in the first and well coordinates in the second column. References to external data resources for each substrate name can be obtained using substrate_info():

```
R> subst.info <- substrate_info(substrates)
R> subst.info
```

By default this yields CAS numbers (http://www.cas.org/content/chemical-substances/faqs), but MeSH names (useful for conducting PubMed queries; see http://www.ncbi.nlm.nih.gov/mesh/) (Coletti and Bleich 2001), ChEBI IDs (Hastings, de Matos, Dekker, Ennis, Harsha, Kale, Muthukrishnan, Owen, Turner, Williams, and Steinbeck 2013), KEGG compound IDs, KEGG drug IDs (Kanehisa, Goto, Furumichi, Tanabe, and Hirakawa 2010) and MetaCyc IDs (Caspi, Altman, Dreher, Fulcher, Subhraveti, Keseler, Kothari, Krummenacker, Latendresse, Mueller, Ong, Paley, Pujar, Shearer, Travers, Weerasinghe, Zhang, and Karp 2012) IDs have also been collected for the majority of the substrates. Using the "browse" argument, full URLs can be created and optionally also directly opened in the default web browser. Using the "download" argument, if KEGG drug or compound IDs have been selected, these can be downloaded from the KEGG server if the KEGGREST is available and converted into customized objects. It is possible to nicely display all available information at once:

```
R> subst.info <- substrate_info(substrates, "all")
R> subst.info
```

Another use of substrate_info() is to convert substrate names to lower case but protecting name components such as abbreviations or chemical symbols. See the manual for further details, help page ?substrate_info.

5. Acknowledgements

The integration of missing OmniLog® substrates into ChEBI by the ChEBI staff is gratefully acknowledged.
